

Novel biotechnological strategies for the detection of ostreid herpesvirus

Mònica Campàs, Anna Toldrà, Karl B. Andree, Edgar Bertomeu, Ana Roque, Noèlia Carrasco, Ignasi Gairín, Dolors Furones

VIVALDI final meeting – Brest 28/11/19

The objective

To exploit magnetic beads for the capture and pre-concentration of ostreid herpesvirus

To develop an electrochemical biosensor for the detection of ostreid herpesvirus

Magnetic beads to capture the virus: the strategy

Rapid, simple and cost-effective MB-based viable OsHV-1 capture strategy

Virus

Magnetic beads

Virus capture

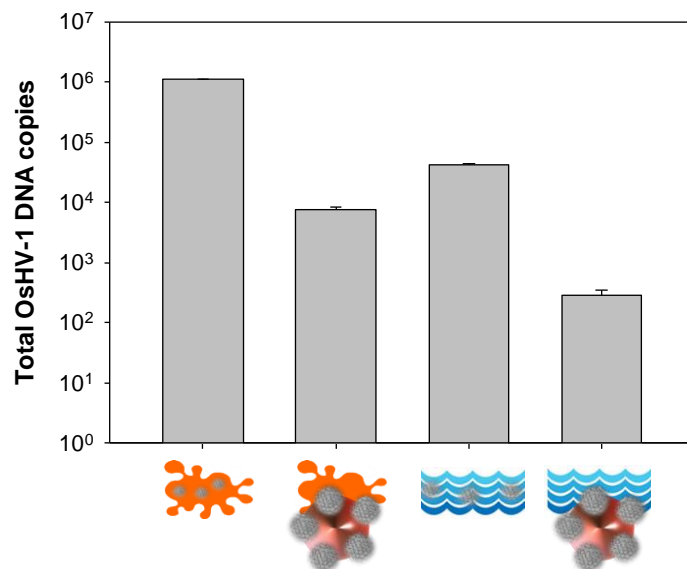

MB-virus conjugates

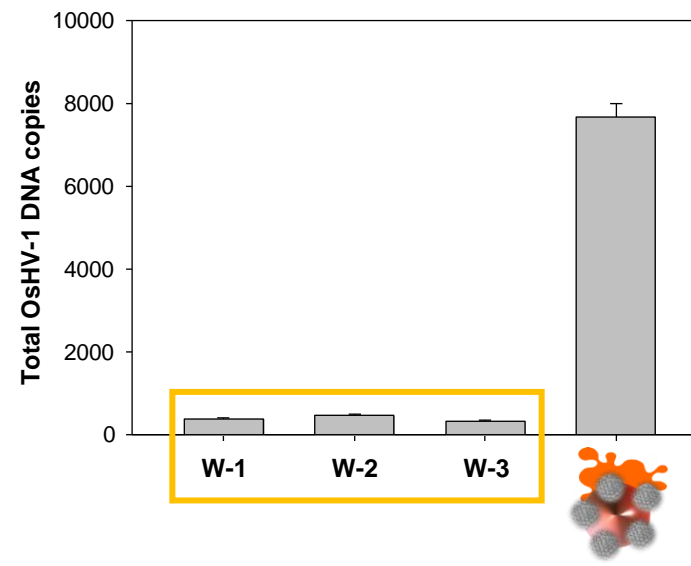

Experimental design

Virus capture and detection

MBs are able to capture the virus from both the homogenate and the seawater

The viral DNA detected in the conjugates came from virus particles captured by the MBs

Virus capture and detection

Homogenate dilutions

MBs were not saturated

MBs dilutions

Steric impediments may decrease capture efficiency

Experimental infections

intramuscular injection

~30 oysters/aquarium

MB-conjugates

Positive controls

Negative controls

homogenate

seawater

sterile water

homogenate MBs

seawater MBs

bare MBs

Mortality monitoring, DNA analyses and RNA analyses

Mortality monitoring

MB-conjugates are able to infect oysters

DNA analyses

dead/moribund oysters
 living oysters

viral DNA loads:
moribund/dead oysters > living oysters

MB-conjugate with
the homogenate

MB-conjugates are able to
infect oysters

RNA analyses

viral genes

no differences among ORFs

viral gene expression:
moribund oysters > living oysters

Pre-concentrating agents: homogenate

Experimental conditions:

MBs volume

Elution volume

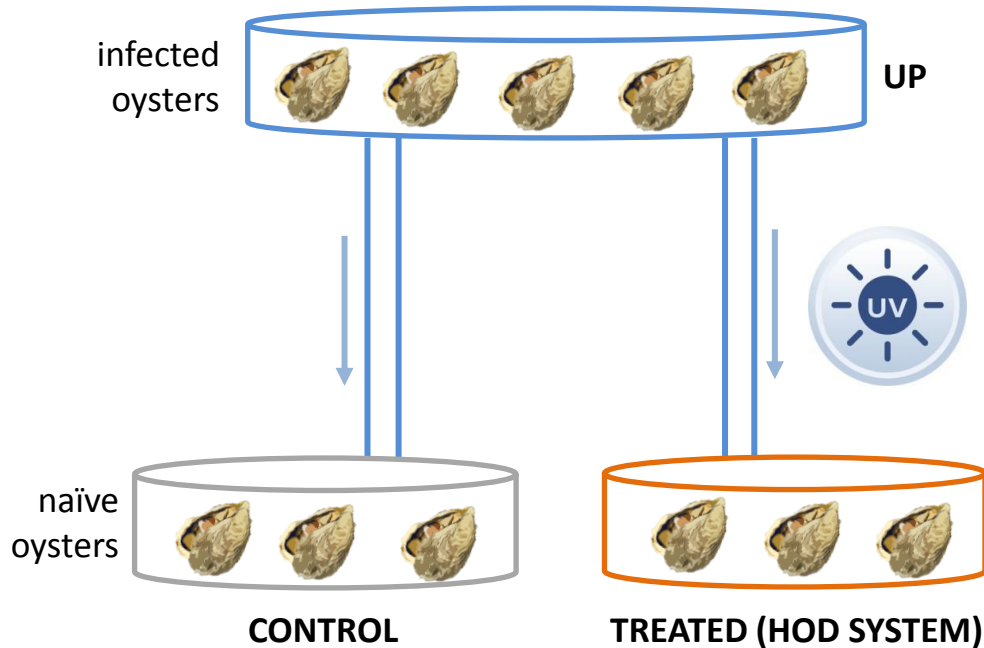

Sample volume

MBs are able to pre-concentrate OsHV-1 at least 100 times

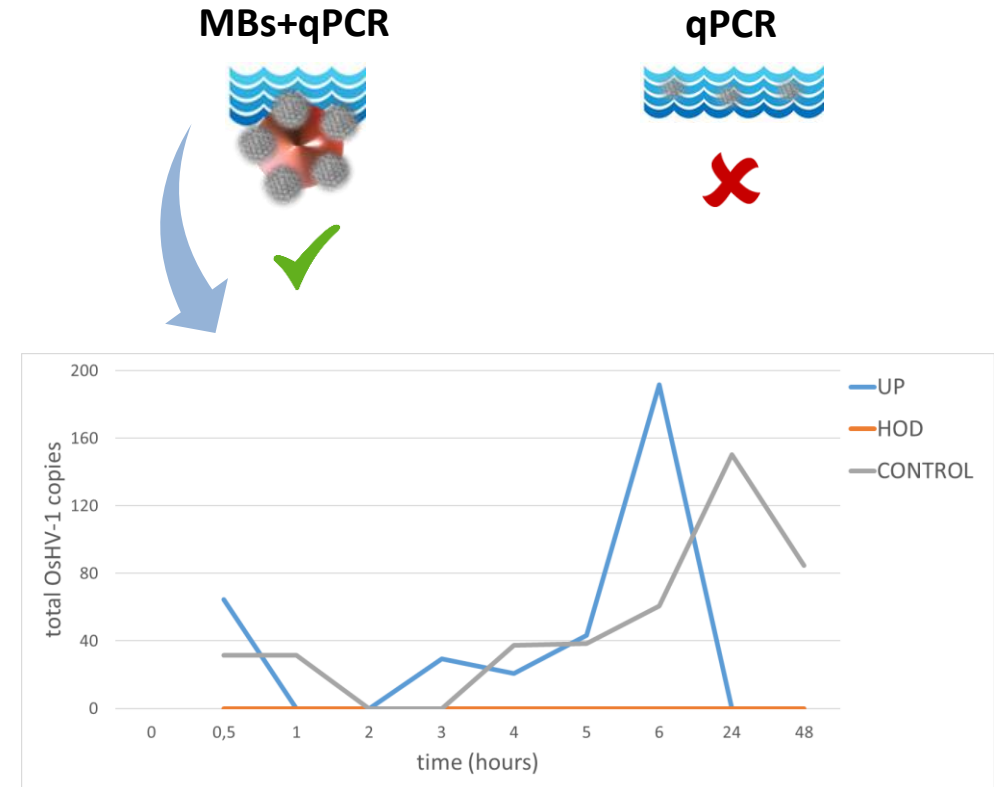

Pre-concentrating agents: seawater

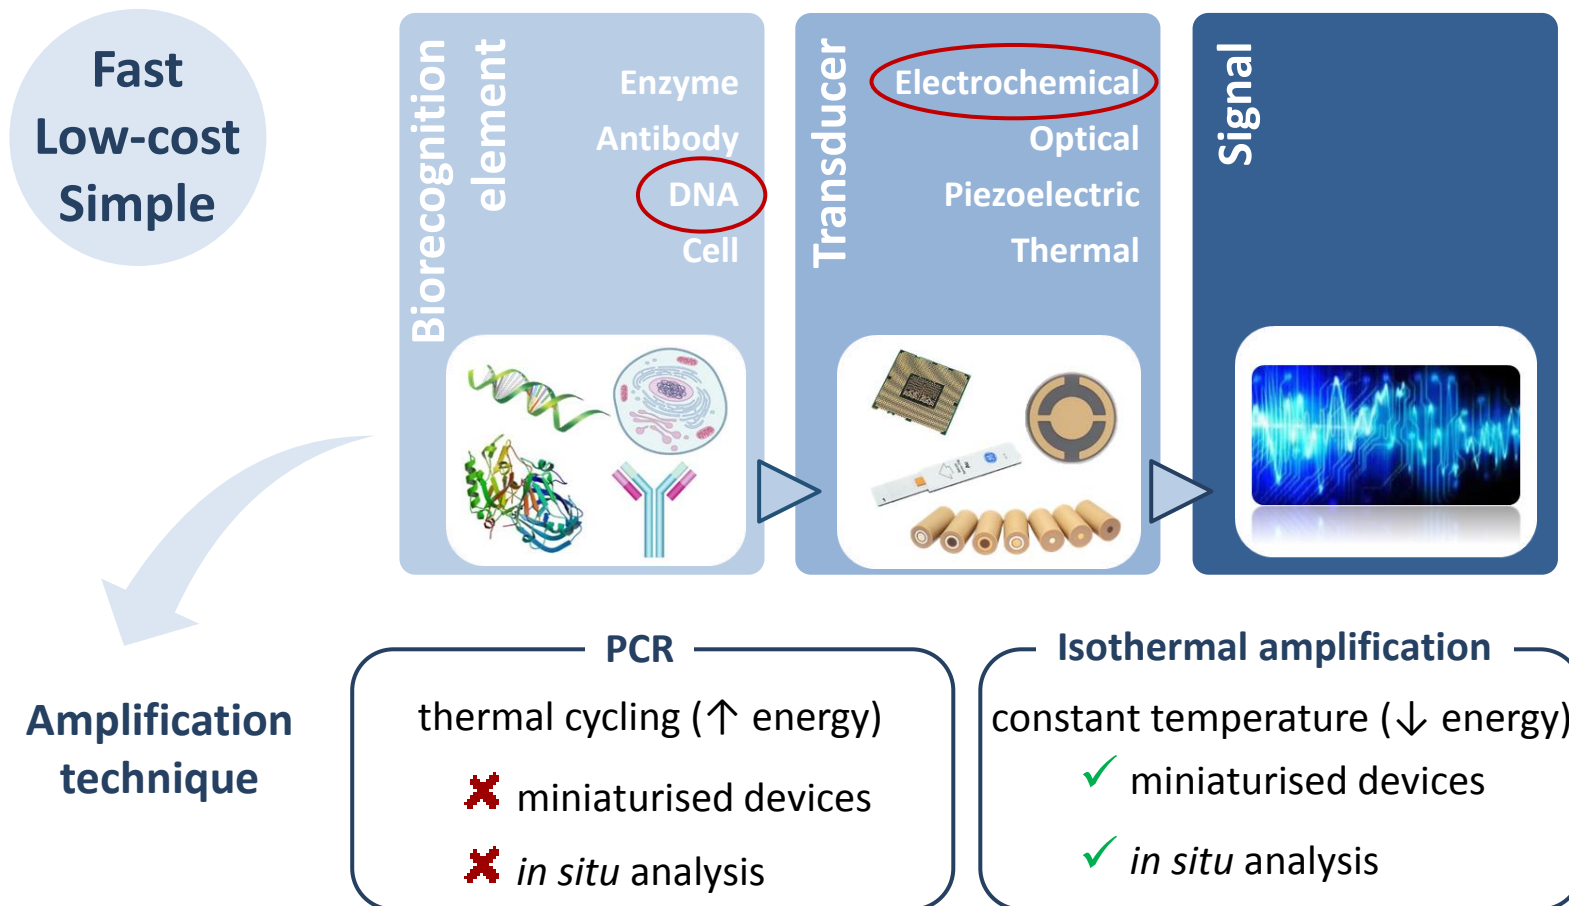

Application to seawater from a depuration experiment (April 2019)

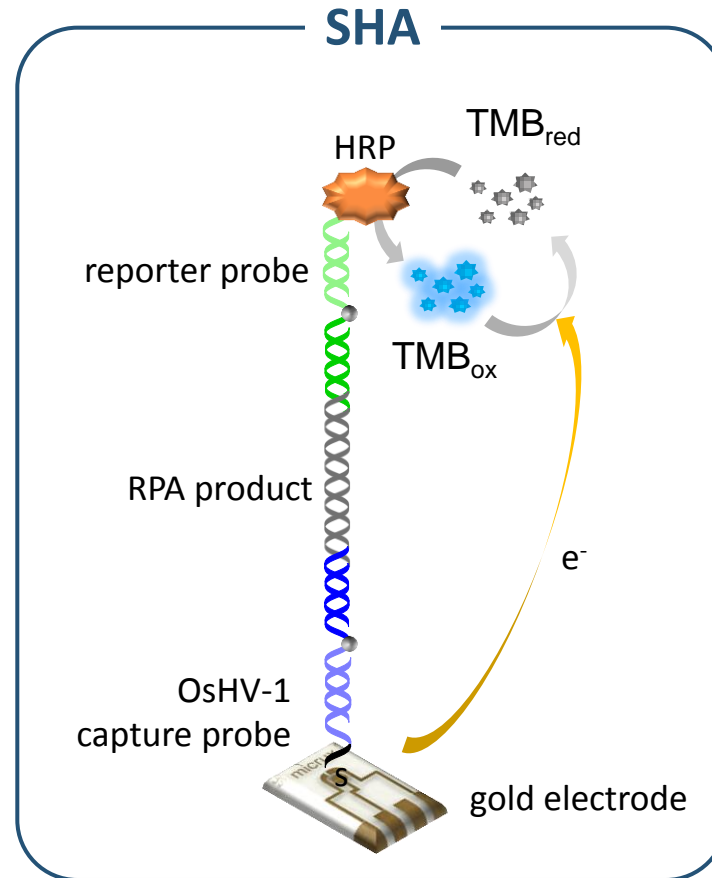

- no oyster mortality
- no OsHV-1 in oysters

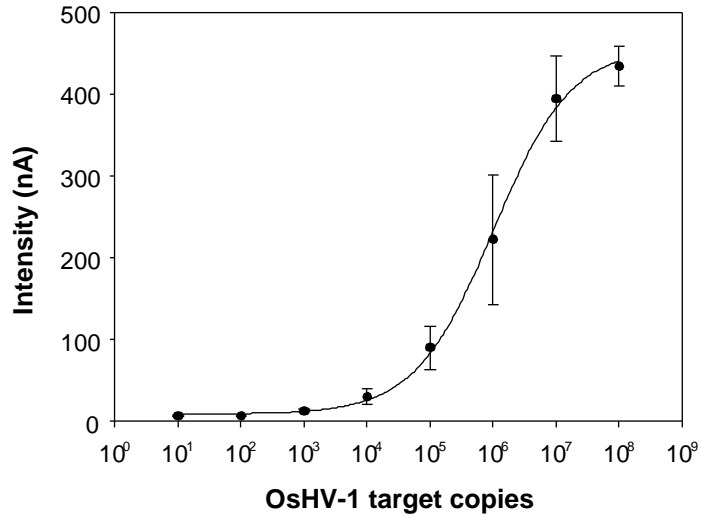

DNA-based biosensor: the strategy

Experimental design

Calibration curve and storage stability

LOD biosensor = 207 copies

LOD qPCR = 4 copies

Overnight

Predicted stability of
3 months at -20 ° C

Ready-to-use
functionalised electrodes

Analysis of oysters

Sample	Physical state	Aquarium	OsHV copies/50 ng total DNA	
			Biosensor	qPCR
1	dead	treated	3.34×10^5	7.13×10^5
2	dead	treated	4.78×10^5	4.81×10^5
3	dead	treated	7.26×10^4	1.79×10^5
4	dead	treated	6.10×10^3	6.52×10^3
5	dead	treated	5.21×10^3	4.38×10^3
6	dead	treated	2.75×10^3	1.98×10^3
7	alive	treated	1.97×10^2	1.21×10^2
8	alive	treated	5.27×10^2	7.83×10
9	alive	treated	1.50×10^2	3.24×10

excellent agreement

Summarising

- ✓ MBs are able to **capture OsHV-1** from both the homogenate and seawater.
- ✓ Both homogenate and seawater conjugates have the ability to **infect** oysters.
- ✓ MBs are able to **pre-concentrate** virus particles at least 100 times.
- ✓ MBs are able to pre-concentrate viruses from **seawater**, being closer to an early warning system.

- ✓ An **electrochemical biosensor** for the detection of OsHV-1 has been developed.
- ✓ The biosensor exhibits **good analytical performance**, specificity, sensitivity and storage stability.
